INTRODUCTION

The US economy enters the second half of 2008 in unstable waters. Growth has weakened considerably, while unemployment and consumer prices have risen sharply. Though it remains to be seen if this ends up being classified officially as a recession, there is no question that the economy is suffering more than just a mid-cycle slowdown. With rebate checks hitting consumer hands, the worst of the financial turmoil may be behind us, but a rebound is not near either -- we do not expect a sustained recovery until mid-2009 at the earliest.

The impact of these economic troubles on the nation has been slightly cushioned by the showing of the nation's 363 metropolitan areas, which have outperformed their non-metropolitan brethren over the past year. Home to 85.9% of employment (117.9 million jobs), 90.1% of wage income (\$5.7 trillion), and 89.9% of production of products and services (\$12.4 trillion) in 2007, metro areas are the key drivers of the nation's economic performance.

While metros have helped prevent a more severe downturn, there is no doubt that they are bearing a heavy burden as a result of the current economic weakness. No area is immune to higher gas and food costs, while job losses, home price declines, and foreclosures are spreading across the country as well. On top of this, certain areas are in particularly difficult straits - 80 metros never fully recovered jobs lost during the 2001 recession and many of them will end the decade with a net employment decline. Meanwhile, metro areas are expected to suffer a \$1.46-trillion decline in property values in 2008. This is particularly troublesome considering the critical role that metropolitan areas play in the nation's economy. The synergy provided by resources such as labor, extensive business networks, and cutting-edge research at institutes of higher learning, attracts both capital and entrepreneurs to metro areas. As a result, metro areas are at the center of the development of many new technologies and play a major role in shaping the future economic development of the US economy and its global competitiveness.

THE RECENT PERFORMANCE OF METRO AREA ECONOMIES

Metropolitan area growth slowed in 2007 but remained healthy even as the housing crisis and higher oil prices began to significantly impact the economy. Overall, real Gross Metro Product (GMP) rose 2.0% last year, down from 3.2% a year earlier. Housing woes and manufacturing cuts hurt, in particular, Michigan, Indiana, Ohio, and Florida causing 62 of the nation's 363 metro areas to suffer declines in 2007, including 14 that fell at least 2%. In contrast, an equal number surged by 5% or more, and 84 saw gains of at least 3%, according to our latest estimates. Hurricane Katrina rebuilding in the Gulf Coast has spurred soaring growth there, while high energy and commodity prices along with fairly stable housing markets have buoyed many western and Texas metros (see Appendix Table 7).

THE SCOPE OF METRO AREA ECONOMIES

Combined, metros produced \$207 billion (92%) of the \$226 billion increase in real output that the United States experienced in 2007, a testament to the key role that metropolitan areas continue to play in the country's economy. Metro areas cover only 26% of the U.S.

land area, yet account for more than 83% of the nation's population, employment and output. The concentration and intertwining of businesses, skilled labor and consumer markets propels competition and innovation, which in turn helps to keep downward pressure on costs and allows the metro areas to be ever more productive. Metro areas provide new industries with crucial amenities, including a diverse and ample supply of labor, financial and physical capital, access to national and international markets, and a local base of technical knowledge, which are essential for their initial development and eventual success.

Metro areas are acutely shaped by economic activity that crosses not only state but also national borders. Trade liberalization and economic integration are further reducing the residual effect that political boundaries have on international economic activity. Consequently, metro area economies compete in a truly global marketplace, in the US and abroad, alongside politically defined states and nations.

The flow of goods and services among metro areas is comparable to trade flows between nations. Consider how these engines of growth compare in a broader international context—when comparing the output of the nation's metro economies with those of international economies, the importance of metros to the US is clear. Our analysis shows that in 2007, among metros areas, New York was the largest US producer of economic activity, generating value of \$1,210 billion. If a country, it would have ranked 12th among all world economies. Los Angeles and Chicago would, in such a ranking, also appear in the top 20, and Washington and Houston in the top 30. Of the 100 largest international economies in the world, 40 are US metro areas (see Appendix Table 2).

FIGURE 1: MOST ECONOMIC ACTIVITY OCCURS IN METRO AREAS

2007		Metro Areas	Rest of U.S.	United States
Size	Population (Millions)	252	50	302
	Share of US	84%	16%	
	Land Area (Square Miles, 000s)	909	2,629	3,538
	Share of US	26%	74%	
Jobs & Output	Employment (Millions)	118	19	137
	Share of US	86%	14%	
	Gross Domestic Product (Billions)	\$12,358	\$1,385	\$13,743
	Share of US	90%	10%	
High Value-Added Employment Sectors	Financial Services (000s)	7,549	748	8,297
	Share of US	91%	9%	
	Prof. and Business Services (000s)	16,473	1,397	17,870
	Share of US	92%	8%	

Shifting the focus to a national rather than an international stage, the size and importance of metro areas to the US is readily apparent. In 2007, the output from the ten largest metro areas was greater than the combined gross state product of the 37 smallest states (see Appendix Table 4). The New York metro area, for example, has a GMP larger than the combined product of Pennsylvania and New Jersey. The metro area is itself a larger producer than all but one US state, California. The Los Angeles metro produces more than all but four states (see Appendix Table 3). Combined, the 50 largest metro areas, from New York to Raleigh, generated a value of \$8.9 trillion in 2007, nearly two thirds (64.9%) of US GDP. Raleigh's GMP alone was greater than that of eight states.

The importance of the metro areas within a state is also clear. In many cases, a metropolitan area is the largest component of a state's economy, and across the nation there are 18 metro areas that account for more than 50% of the output in their state. Likewise, an additional 30 metro areas individually account for more than 25% of the output of their respective states (see Appendix Table 5). For example, Birmingham is responsible for 32.7% of Alabama's total output, while Minneapolis accounts for 72.7% of Minnesota's. These figures underscore the fact that in urbanized states the majority of economic activity occurs in metro areas. California metros, for example, generate 97.5% of the state's output. Furthermore, in 32 states the combined metro economies contribute 75% or more of the state's total economic output.

METROPOLITAN AREA EMPLOYMENT BETWEEN DOWNTURNS

As the U.S. weathers the current slowdown, it is an opportune time to draw comparisons to the last downturn in 2001. While the factors influencing the respective downturns vary, both were precipitated by the bursting of speculative bubbles, a result of overzealous investors running up asset prices far above what the market could sustain. The dot-com crash in the early 2000's decimated the high-tech sector and subsequently had spillover effects into other industries. The current slowdown, spurred by the widespread housing correction, has eroded home-owner equity and exacerbated the current cycle of foreclosures. Financial institutions, which had thrived due to the availability of credit and lenient borrowing practices, are now experiencing the consequence of this indulgence; lending standards have tightened across the industry, curbing consumer spending. The current woes have done a number on construction and finance employment. The former has declined 4.3% since its mid-2006 peak, a loss of 331,000 jobs nationally; meanwhile, the latter has fallen 1.1% since topping out just over a year ago, costing the economy 93,000 jobs. The damage is spreading into other sectors of the economy as the strain of weakened housing markets, dimming employment prospects, and higher oil and food prices has put considerable pressure on the consumer. However, the extent of the current slowdown and future recovery, as with the 2001 recession, varies widely among metropolitan areas, the economic centers of the U.S.

Prior to the 2001 downturn, employment in the U.S. peaked in the first quarter of 2001. In the second quarter of 2005, the nation finally surpassed its pre-recession employment level and then recorded 10 straight quarters of job gain before dipping in the first quarter of 2008. Accounting for 86% of national employment, the metropolitan areas have followed a similar path, but they surpassed pre-recession employment a quarter sooner, and have yet to see an overall decline.

Individually, however, there is much divergence across the nation. Since the 2001 recession, 282 metro areas have surpassed their previous employment peak, with 173 yet to experience a job drop on a quarterly basis. Significantly, though, the remaining 80 metropolitan areas began the current economic downturn without having recovered from the previous one (Appendix Table 8). Severe losses in 2001 and/or a tepid recovery since then have combined to keep job numbers in these areas below where they were more than seven years ago. In fact, with additional economic weakness expected for at least another year, many of these metropolitan areas will likely end the decade with fewer jobs than they started with (Appendix Table 9). Our forecast suggests that 71 - nearly one-fifth of the nation's 363 metro areas - will remember the 2000s as a decade of job-base deterioration,

the most widespread impact in the last half-century, surpassing the 1980s when nearly 14% of metros lost jobs. The current decade has been particularly unkind to the manufacturing belt of the Great Lakes region -- the region is home to more than half of the metros that are expected to lose employment over the ten-year period.

TOP JOB PERFORMING METROS

Surging housing markets had a positive influence on the metropolitan area economies with the largest *peak-to-peak* employment gains; that is, the difference between the current job level peak and the employment peak prior to the 2001 recession (Appendix Table 8). During the height of the construction boom, average employment in the sector grew 4.9% year-over-year; the top job performing metros (in terms of peak-to-peak percent change) rose almost three times as fast, thanks to a surging population driven by job seekers and retirees drawn by inexpensive housing and warm climates. These metros also had limited exposure to the high-tech and manufacturing sectors, which were hit the hardest in 2001.

FIGURE 2: LARGEST PEAK-TO-PEAK JOB GAINS
(PRE-2001 RECESSION VS BEFORE CURRENT SLOWDOWN)

Phoenix-Mesa-Scottsdale, AZ	307,100
Houston-Sugar Land-Bay Town, TX	298,300
Washington-Arlington-Alexandria, DC, VA, MD, WV	289,400
Riverside-San Bernardino-Ontario, CA	233,800
Miami-Fort Lauderdale-Miami Beach, FL	220,600

In addition, the metro areas that experienced the largest job gains (figure 2) have transitioned well to the nation's expanding service-sector led economy. These areas are not tied to old-economy industry; strong migration to these metros, like Phoenix and Houston, have added to the pool of qualified workers, which in-turn makes these areas a more attractive spot for further business expansion.

WEAKEST JOB PERFORMING METROS

The weakest-performing metropolitan areas have a peak-to-peak decline; that is, job levels prior to the current slowdown topped out *below* their-2001 apex (Appendix Table 8). Fifteen of the sharpest drops occurred in metro areas located in the rust-belt states of Michigan, Ohio, Indiana, and Illinois, including Detroit, Cleveland, Dayton (OH), Flint (MI), and Kokomo (IN). While this region had very limited exposure to the dot-com bust and housing market speculation, the exodus of manufacturing jobs, particularly in the struggling U.S. automobile manufacturing industry, has been a profound burden on these economies -- slowing income gains, reducing housing affordability, and driving up foreclosures. Domestic auto assembly is deep-rooted in the region but foreign competition and rising health-care costs have pushed down sales, profit-margins, and production. U.S. companies have been forced to consolidate, directly reducing not only transportation equipment manufacturing but also fabricated metal and machinery, as suppliers have had to shut operations.

FIGURE 3: LARGEST PEAK-TO-PEAK JOB LOSSES
(PRE-2001 RECESSION VS BEFORE CURRENT SLOWDOWN)

Detroit-Warren-Livonia, MI	-163,500
San Jose-Sunnyvale-Santa Clara, CA	-155,000
San Francisco-Oakland-Fremont, CA	-113,700
Boston-Cambridge-Quincy, MA-NH	-72,700
Cleveland-Elyria-Mentor, OH	-59,700

While old-economy manufacturing metros are a stark contrast to new-economy high-tech areas, the two groups have had the most difficult time regaining lost jobs. San Jose, San Francisco-Oakland, and Boston all suffered heavy losses in high-tech during the 2001 downturn that they have been unable to regain so far. Combined, the 80 metros that did not fully recover begin this slowdown with more than 900,000 fewer jobs than at the start of the 2001 recession.

THE ECONOMIC OUTLOOK

Metropolitan economies will experience a stark slowdown over the next two years as the hardships in the real estate and credit markets shake out. Following average annual gains of 2.8% from 2005-07, growth in real gross metro product (GMP) will be cut in half in 2008 to 1.4%, with over three-fourths of individual metro areas decelerating; 2009 will offer only marginal improvement, at 1.5%. However, the extent of the slowdown on the underperforming metro economies will ease over the next two years. In 2008, 142 of 363 metros (39%) will register below 1% real GMP growth, 33 (9%) of those actually contracting; a year later the figures will fall to 127 (35%) and 10 (3%), respectively (Appendix Table 7).

Metro employment growth of 1.2% in 2007 will fall to 0.4% this year, not reaching above-1% growth until 2010 (Appendix 6). The fallout in construction employment has disproportionately impacted coastal area metros; continued weakness in manufacturing has led to slimming payrolls in Midwestern metros. Furthermore, service sector employment will generally cool until US market conditions improve. Overall, 262 metro areas (72%) will have slower job growth in 2008 than in 2007.

FIGURE 4: LARGEST REAL GMP GAIN, 2008
(MILLIONS)

New York-Northern New Jersey-Long Island, NY-NJ-PA	\$ 20616.2
Houston-Sugar Land-Bay Town, TX	\$ 9956.5
Dallas-Fort Worth-Arlington, TX	\$ 9277.9
Seattle-Tacoma-Bellevue, WA	\$ 4826.6
Washington-Arlington-Alexandria, DC-VA-MD-WV	\$ 4733.3

Though general cooling will persist over the majority of metropolitan areas, there are still a number of places that will register historically high real GMP growth. Almost a third of the thirty fastest growing metros in 2008 are in Texas; generally, these areas (such as Odessa, expected to record the second strongest increase in the country, at 5.0%) have had limited

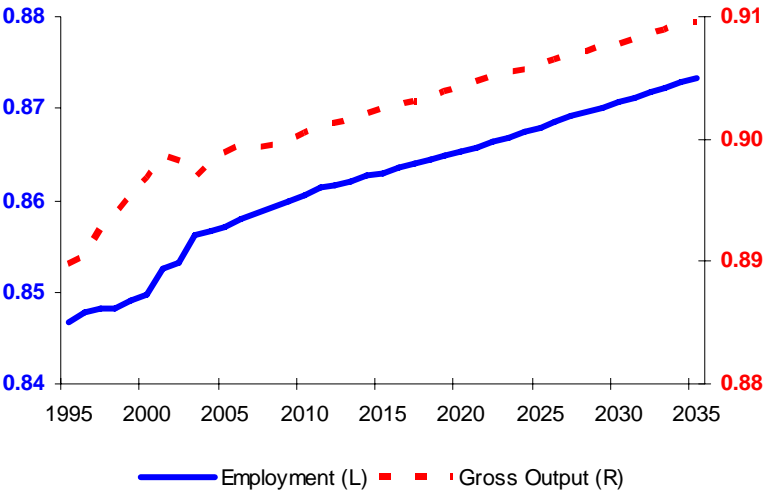

exposure to the housing correction and possess large natural resource and export industries, two bright spots in the faltering US economy. Fast growing metro areas in Utah and Colorado as well as post-Katrina Louisiana have similar advantages. In terms of real output, the largest dollar gains will come from New York, Houston, and Dallas (Figure 4). The biggest percentage increases are projected for Houma (LA), Odessa (TX), and El Paso (TX) (see Appendix Table 7).

FIGURE 5: LARGEST REAL GMP LOSS, 2008
(MILLIONS)

Detroit-Warren-Livonia, MI	-\$ 1507.1
Cape Coral-Fort Myers, FL	-\$ 323.9
Flint, MI	-\$ 272.1
Sarasota-Bradenton-Venice, FL	-\$ 266.1
Naples-Marco Island, FL	-\$ 214.5

In contrast to this, more than 70% of the nation's metros in 2008 are expected to record less than 1% job growth, the rate that is typically needed to absorb new entrants into the job market. As a result, 283 (78%) metropolitan areas will see more than a 0.2 percentage point increase in the unemployment rate. Furthermore, one-third of all metros (113) are expected to experience job declines in 2008. In more than 30 cases, the losses will be severe enough to cause output to fall as well. No surprise, Midwestern states and Florida dominate this list, thanks to the ongoing woes in manufacturing and housing. Detroit, with severe cutbacks in automotive, and Cape Coral (FL), where home prices have fallen for eight consecutive quarters and new construction has plummeted, will have the largest dollar declines in real output in 2008 (Figure 5). The biggest percentage decreases will occur in Flint (MI), Carson City (NV), and Cleveland (TN).

FIGURE 6: THE CONTRIBUTION OF METRO AREAS TO THE NATIONAL ECONOMY WILL CONTINUE TO GROW
(Ratio of Metro Economies to the U.S.)

Troubles from real estate and surging consumer prices are expected to finally wane next year, and a sustained recovery will begin around mid-2009. Metro area job growth will improve to 0.7% in 2009, with New Orleans reconstruction and a still-strong Texas economy leading the way. Nevertheless, 73 metros will still see job declines next year, particularly in the Midwest.

In terms of GMP, fewer metro areas (10) will have output declines next year, before all are expected to turn around to positive gains in 2010. Even in the midst of this turmoil, metros will continue to comprise an increasingly large share of national output. By 2010, they will contribute more than 90% of national GDP, rising to 91% over the next thirty years (Figure 6).

THE MORTGAGE CRISIS: AN UPDATE

In previous reports, we have detailed the effects of the housing and credit crises on metro area and state economies. With new data and an updated outlook, results reveal that the situation has only worsened in the last six months.

CURRENT HOUSING SITUATION

At the national level, housing starts continue to decline. The first quarter marked one of the lowest levels of activity in the 60-year history that data has been collected. Yet we do not believe this is the bottom: new construction will fall even further over the course of the year, reaching an all-time low of 930,000 starts for 2008. Existing home sales and housing prices are also declining and are expected to continue to do so for the rest of the year, as foreclosures continue to grow and unsold inventories remain high. By the end of 2008, starts and existing sales will be 60% and 37%, respectively, below their recent peaks, while home prices will have fallen about 10% from its high.

At the local level, nearly all metropolitan areas have seen a decline in starts, while more than half are experiencing falling prices. The biggest price deterioration is in Florida and California – the 24 hardest hit are located in those two states alone. Meanwhile booming energy markets have propelled Odessa and Midland (TX) to the top of the list with continued strong home-price gains.

ERODING PROPERTY VALUES

The recent decline in home prices in many areas of the country has stripped homeowners of equity, constraining both consumers' ability to spend as well as local tax revenues. In a November 2007 report we projected that homeowners would see property values fall by \$1.2 trillion in 2008. Less than eight months later, we find the picture even grimmer: values are now expected to tumble \$1.46 trillion this year. The increased loss is a result of even greater deterioration in home markets and prices than anticipated. Almost all metro areas – 336 out of 360 (93%) – are expected to see some sort of decline. Los Angeles will see the biggest total drop at \$203 billion, followed by Washington DC, San Francisco, and Riverside (CA) (see Appendix Table 10). On the flip side, just 24 metros will actually see property values continue to rise. Most are fairly small and scattered throughout the country, but the two

largest are in North Carolina: Charlotte and Raleigh. Both of these metros did not experience a large run-up in prices or extreme speculation. Additionally, solid economic growth continues to buoy income gains, keeping homes affordable. Property values in each are expected to rise \$1.2 billion this year. The other 22 metros will see a combined increase of \$2.5 billion.

Because the largest metros will likely have the greatest dollar changes, another way to look at the results is to consider the lost value per home. This analysis shows the impact most strongly in (no surprise) California and Florida. Salinas (CA) is projected to suffer property losses of \$11.9 billion, or \$120,000 per home. It will be closely followed by Santa Barbara, - \$119,000, and Naples (FL), whose homeowners will see a projected \$103,000 decline in their property values.

Municipalities in these areas are now faced with a triple whammy: tax collections are weakening or even declining because of slower sales tax receipts and lower property taxes (both a result of declining equity) and reduced transfer taxes (as home sales have fallen). In this way, some of the hardest hit economies are also feeling extreme fiscal strain in their government sector.

FORECLOSURES

The downturn in the residential real estate market will continue to limit the resale opportunities of homeowners facing payment difficulties. Sales continue to be negatively affected by the lack of credit available to prospective buyers. Sales will also be impacted by a glut of foreclosed properties that are listed for a fraction of the amount owed on them, as well as the uncertainty that follows weaker general economic conditions. Home price declines have meant that the price sellers could get for their home is sometimes less than their outstanding mortgage balance. Homes already foreclosed on adversely affect sellers as well, adding to the inventory of homes competing for buyers, and their presence in neighborhoods negatively affects the perceived value of other homes nearby. The credit markets continue to be less hospitable to re-financing and initial borrowing. Adding to this stress are the reduced job opportunities resulting from slower economic growth late in 2007 and into 2008. Such a lack of jobs and income historically leads directly to greater mortgage payment delinquency and subsequent foreclosure.

The peak years for the issuance of sub-prime and other adjustable rate mortgages were 2004 and 2005, and under the most common two-year reset terms, 2006 through 2008 will see the peak number of borrowers pushed into payment difficulty. Unless institutional arrangements are made to bring mortgage holders together with buyers, 2008 will continue to see foreclosure activity accelerate. We forecast that home price declines will be widespread across the U.S., with an average year-to-year decline of 6% in 2008, and ranging as high as 18% in California. Using our current forecast, foreclosure activity is expected to rise to 2.2 million homes, representing a property value of \$488.4 billion. Appendix Table 11 catalogs the distribution of this activity across the states.

Nearly all states have been affected in some way by the loosening of credit standards and the prevalence of adjustable rate mortgage (ARM) lending that occurred over the last several years. Those that have seen the largest increase in the number of both prime and sub-

prime loans going into foreclosure are the areas that posted some of the highest growth during the boom years - Nevada, Arizona, California, and Florida - as well as those that have seen sluggish economic growth, Michigan being one example. During the boom the high growth states were the beneficiaries of significant population and economic growth. However, they were also the target for large numbers of investors and speculators, who were looking to make money from the rapidly appreciating value of homes. As a result of this boom then bust, we estimate that in Arizona the number of loans in foreclosure (both prime and sub-prime) will increase by more than 87,000 in 2008, with the value of housing represented by those foreclosures measuring at least \$17.8 billion.

CONCLUSION

There is no question that metro areas drive the U.S. economy, responsible for more than 85% of jobs, 90% of wage income and production, and 92% of the country's real GDP growth in 2007. It is also clear, however, that with the economy on the cusp of recession, many metros have fallen on hard times, a result of the housing/credit crisis, higher oil/food prices, and manufacturing cuts. Job growth in 2008 will be tepid at best (0.4%) and unemployment will surge, while real GMP gains slow (1.4%) and nearly 10% of areas (33) actually have output declines.

Of significant concern is a group of metro areas, nearly one in five, that are likely to experience no job growth for the entire decade. While national policies, particularly those related to energy and transportation, should be geared to helping all metros increase economic productivity and competitiveness, concerted action may be needed to assist less robust metropolitan areas regain jobs and boost output.

The residential real estate bust continues to affect most all metros in the form of declining housing values and projected foreclosures, and the situation has deteriorated further since our previous report 8 months ago, with a \$1.46 trillion drop in property values now expected for 2008. This sharp decline should indicate to lawmakers of the continuing depth of the mortgage crisis as they consider federal housing legislation to assist homeowners in re-financing and to mitigate the negative effect of foreclosures on surrounding property values and on communities as a whole.
